

Mobile Communications

Chapter 7: Wireless LANs

- Characteristics
- IEEE 802.11 (PHY, MAC, Roaming, .11a, b, g, h, i, n ... z)
- Bluetooth / IEEE 802.15.x
- IEEE 802.16/.20/.21/.22
- RFID
- Comparison

Prof. J6 Ueyama

Mobile Communication Technology according to IEEE (examples)

WiFi

Local wireless networks

WLAN 802.11

ZigBee

Personal wireless nw

WPAN 802.15

Bluetooth

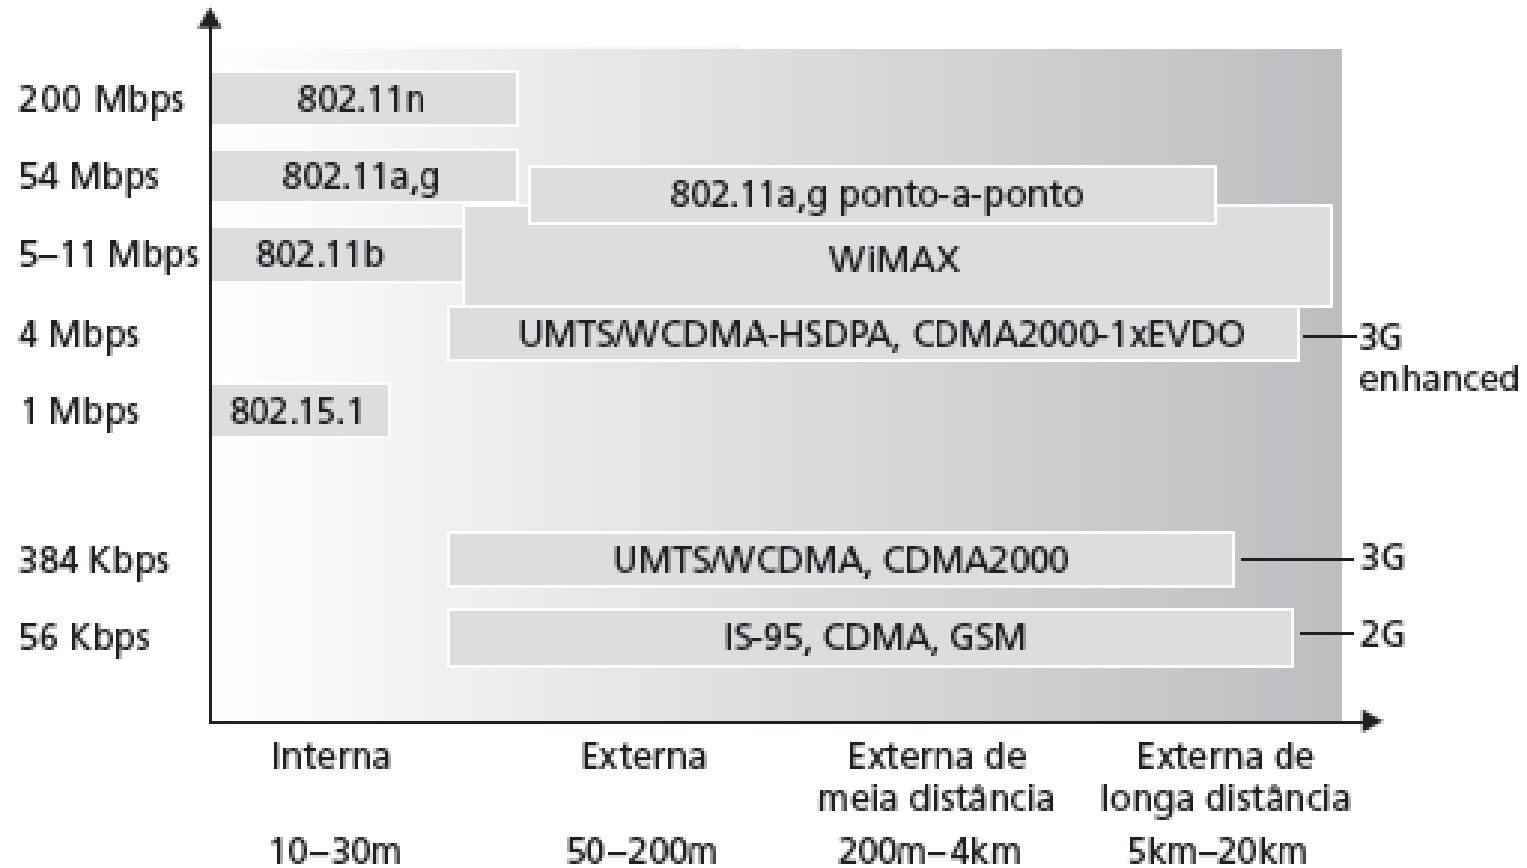

Wireless distribution networks

WMAN 802.16 (Broadband Wireless Access) **WiMAX**

+ Mobility

[802.20 (Mobile Broadband Wireless Access)]
802.16e (addition to .16 for mobile devices)

Main features of the existing wireless technologies

Characteristics of wireless LANs

- Advantages
 - very flexible within the reception area
 - Ad-hoc networks without previous planning possible
 - (almost) no wiring difficulties (e.g. historic buildings, firewalls)
 - more robust against disasters like, e.g., earthquakes, fire - or users pulling a plug...
- Disadvantages
 - typically very low bandwidth compared to wired networks (1-10 Mbit/s) due to shared medium
 - many proprietary solutions, especially for higher bit-rates, standards take their time (e.g. IEEE 802.11n)
 - products have to follow many national restrictions if working wireless, it takes a vary long time to establish global solutions like, e.g., IMT-2000

Design goals for wireless LANs

- global, seamless operation
- low power for battery use (e.g. WSNs and cell phones)
- no special permissions or licenses needed to use the LAN
- robust transmission technology
- simplified spontaneous cooperation at meetings
- easy to use for everyone, simple management
- protection of investment in wired networks (i.e. interoperable with wired LANs)
- security (no one should be able to read my data), privacy (no one should be able to collect user profiles), safety (low radiation)
- transparency concerning applications and higher layer protocols, but also location awareness if necessary

Comparison: infrared vs. radio transmission

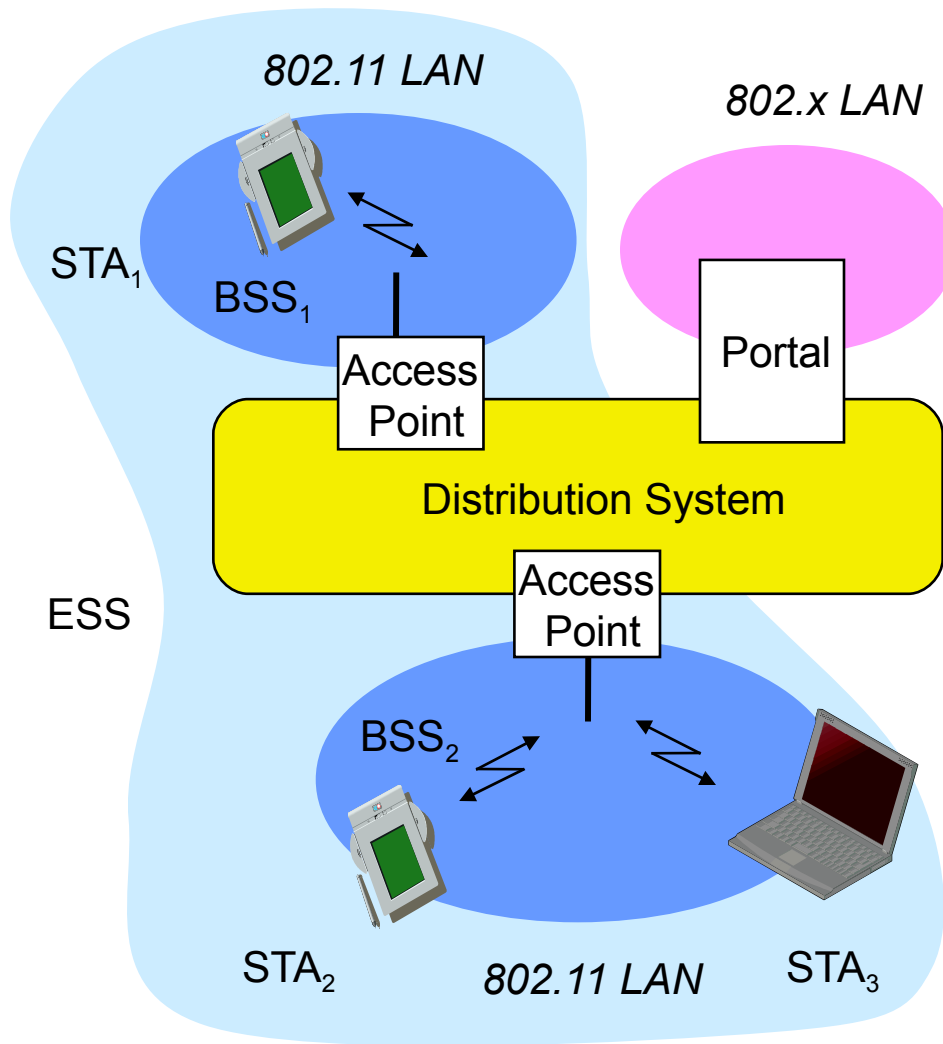

- Infrared
 - uses IR diodes, diffuse light, multiple reflections (walls, furniture etc.)
- Advantages
 - simple, cheap, available in many mobile devices
 - no licenses needed
 - simple shielding possible
- Disadvantages
 - interference by sunlight, heat sources etc.
 - many things shield or absorb IR light
 - low bandwidth
- Example
 - IrDA (Infrared Data Association) interface available everywhere
- Radio
 - typically using the license free ISM band at 2.4 GHz
- Advantages
 - experience from wireless WAN and mobile phones can be used
 - coverage of larger areas possible (radio can penetrate walls, furniture etc.)
- Disadvantages
 - very limited license free frequency bands
 - shielding more difficult, interference with other electrical devices
- Example
 - Many different products

Comparison: infrastructure vs. ad-hoc networks

802.11 - Architecture of an infrastructure network

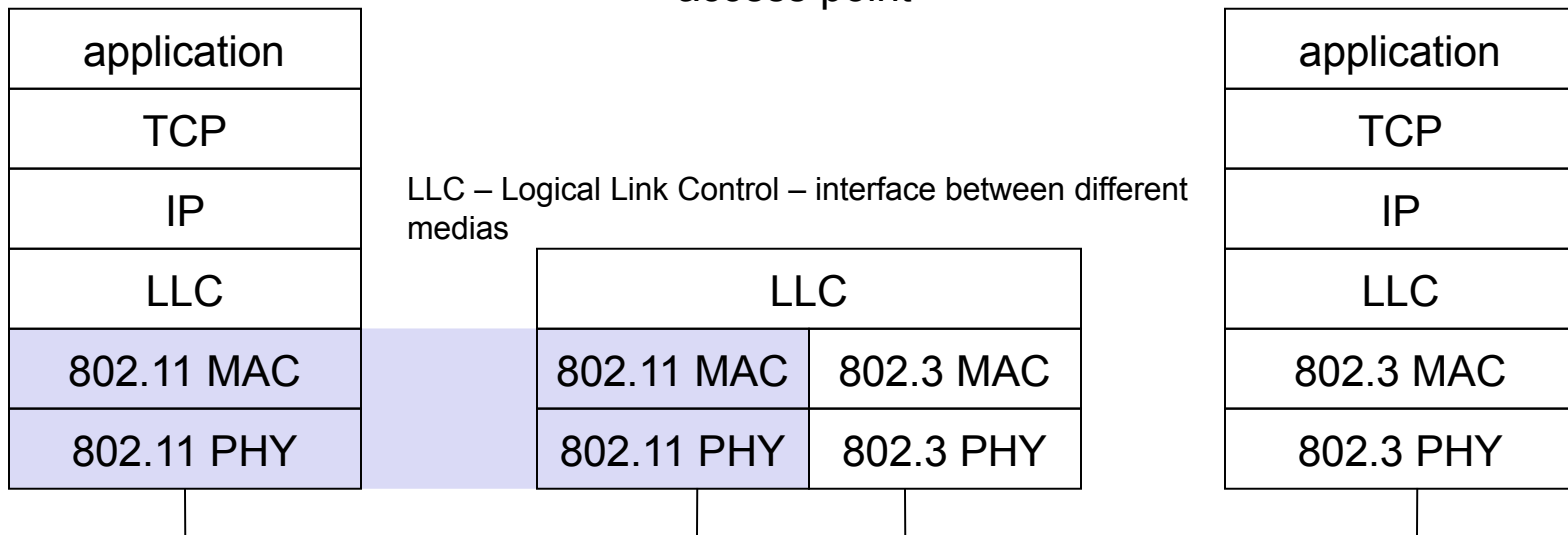

- Station (STA)
 - terminal with access mechanisms to the wireless medium and radio contact to the access point
- Basic Service Set (BSS)
 - group of stations using the same radio frequency
- Access Point
 - station integrated into the wireless LAN and the distribution system
- Portal
 - bridge to other (wired) networks
- Distribution System
 - interconnection network to form one logical network (ESS: Extended Service Set) based on several BSS

802.11 - Architecture of an ad-hoc network

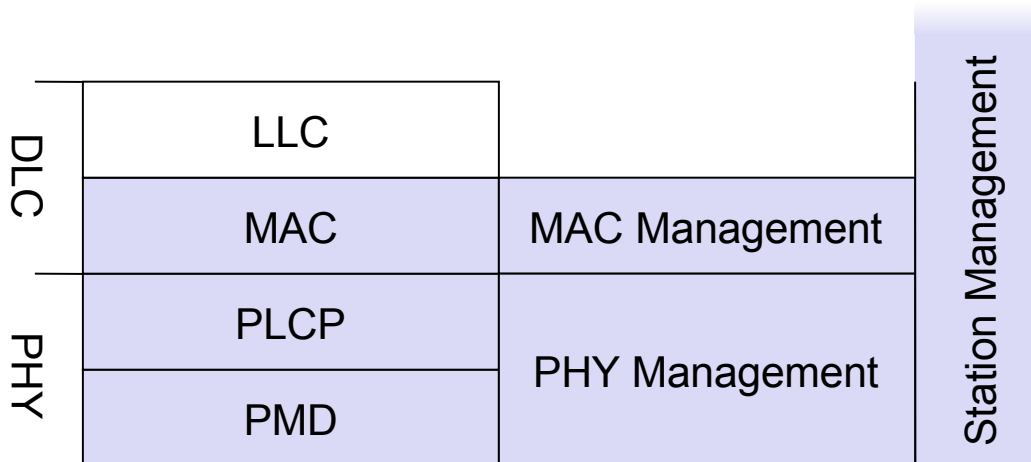

- Direct communication within a limited range
 - Station (STA): terminal with access mechanisms to the wireless medium
 - Independent Basic Service Set (IBSS): group of stations using the same radio frequency

IEEE standard 802.11

802.11 - Layers and functions

- MAC
 - access mechanisms, fragmentation, encryption
- MAC Management
 - synchronization, roaming, MIB, power management
- PHY Management includes
 - PLCP Physical Layer Convergence Protocol
 - clear channel assessment signal (carrier sense)
 - PMD Physical Medium Dependent
 - modulation, coding, transforms bits into signals
- Station Management
 - coordination of all management functions

802.11 - Physical layer (legacy)

- 3 versions: 2 radio (typ. 2.4 GHz), 1 IR
 - data rates 1 or 2 Mbit/s
- FHSS (Frequency Hopping Spread Spectrum)
 - spreading, despreading
 - Frequency multiplexing
- DSSS (Direct Sequence Spread Spectrum)
 - Multiplexes by code (i.e. using a chipping code)
 - Implementation is more complex than FHSS
 - chipping sequence: +1, -1, +1, +1, -1, +1, +1, +1, -1, -1, -1 (Barker code)
 - DATA XOR chipping code
- Infrared
 - Wavelength around 850-950 nm, diffuse light, typ. 10 m range
 - uses near visible light
 - carrier detection, up to 4Mbits/s data rate

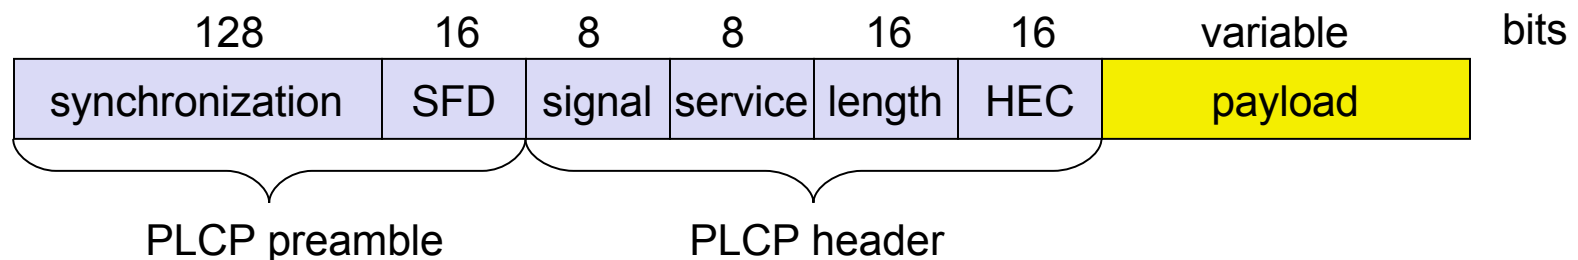

FHSS PHY packet format (legacy)

- Synchronization
 - synch with 010101... pattern
- SFD (Start Frame Delimiter)
 - 0000110010111101 start pattern
- PLW (PLCP_PDU Length Word)
 - length of payload incl. 32 bit CRC of payload, $PLW < 4096$
- PSF (PLCP Signaling Field)
 - data rate of the payload (0000 -> the lowest data rate)
- HEC (Header Error Check)
 - checksum with the standard ITU-T polynomial generator

DSSS PHY packet format (legacy)

- Synchronization
 - synch., gain setting, energy detection, frequency offset compensation
- SFD (Start Frame Delimiter)
 - 1111001110100000
- Signal
 - data rate of the payload (0A: 1 Mbit/s DBPSK; 14: 2 Mbit/s DQPSK)
- Service
 - future use, 00: 802.11 compliant
- Length
 - length of the payload
- HEC (Header Error Check)
 - protected by checksum using ITU-T standard polynomial error check

802.11 - MAC layer I - DFWMAC

- MAC layer has to fulfill several tasks including:
 - control medium access
 - support for roaming
 - authentication
 - power conservation
- In summary, it has two key tasks:
 - traffic services
 - access control

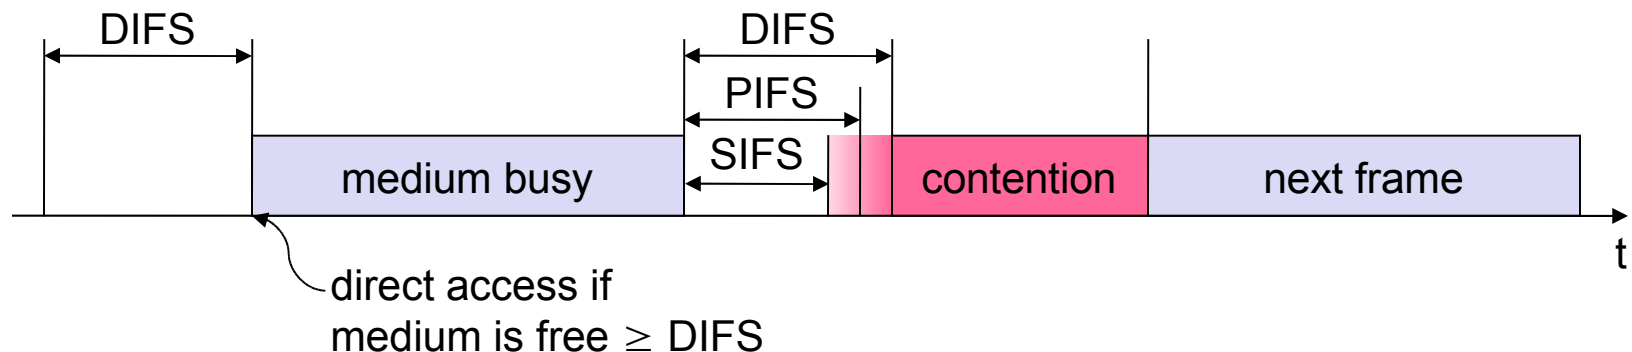

802.11 - MAC layer I - DFWMAC

- Traffic services (two implementations)
 - Asynchronous Data Service (mandatory)
 - exchange of data packets based on “best-effort”
 - support of broadcast and multicast
 - Time-Bounded Service (optional)
 - implemented using PCF (Point Coordination Function)
- Access methods
 - DFWMAC-DCF CSMA/CA (mandatory)
 - collision avoidance via randomized „back-off“ mechanism
 - minimum distance between consecutive packets
 - ACK packet for acknowledgements (not for broadcasts)
 - DFWMAC-DCF w/ RTS/CTS (optional)
 - Distributed Foundation Wireless MAC
 - avoids hidden terminal problem
 - DFWMAC- PCF (optional)
 - access point polls terminals according to a list

802.11 - MAC layer II

- Priorities

- defined through different inter frame spaces
- no guaranteed, hard priorities
- SIFS (Short Inter Frame Spacing)
 - highest priority, for ACK, CTS, polling response
- PIFS (PCF IFS)
 - medium priority, for time-bounded service using PCF
- DIFS (DCF Inter frame spacing)
 - lowest priority, for asynchronous data service

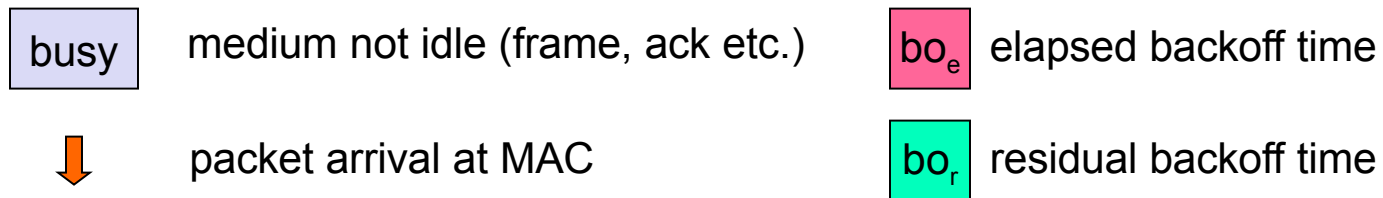

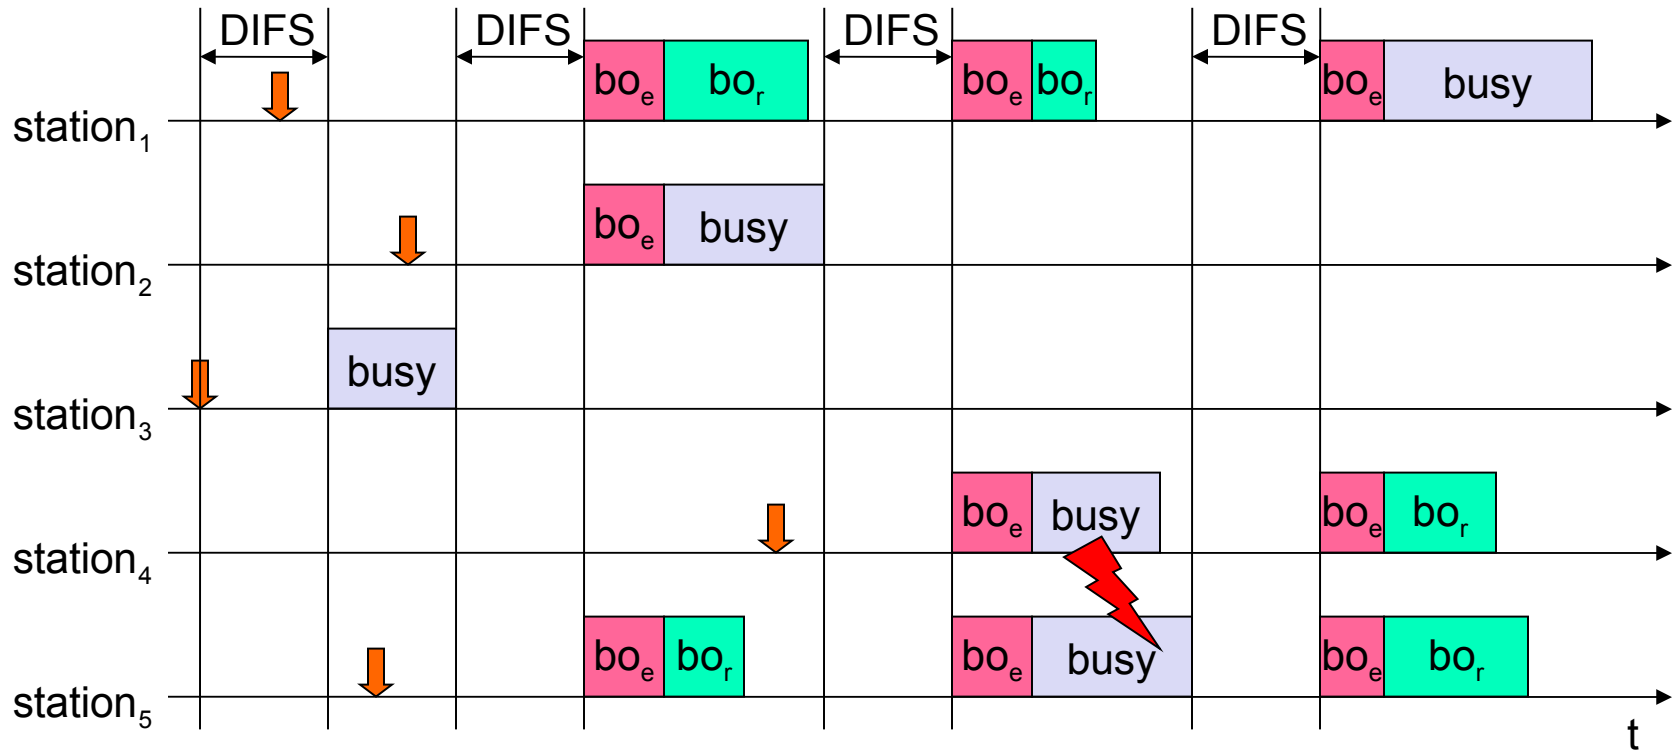

802.11 - CSMA/CA access method I

- station ready to send starts sensing the medium (Carrier Sense based on CCA, Clear Channel Assessment)
- if the medium is free for the duration of an Inter-Frame Space (IFS), the station can start sending (IFS depends on service type)
- if the medium is busy, the station has to wait for a free IFS, then the station must additionally wait a random back-off time (collision avoidance, multiple of slot-time)
- if another station occupies the medium during the back-off time of the station, the back-off timer stops (fairness)

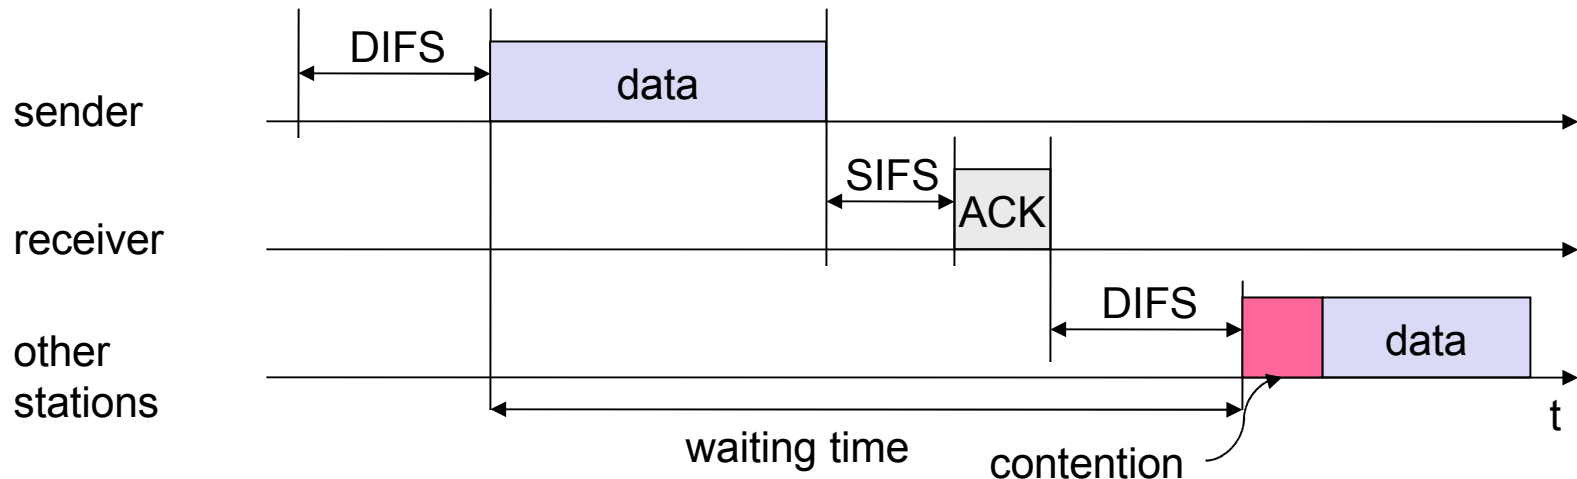

802.11 - competing stations - simple version

802.11 - CSMA/CA access method II

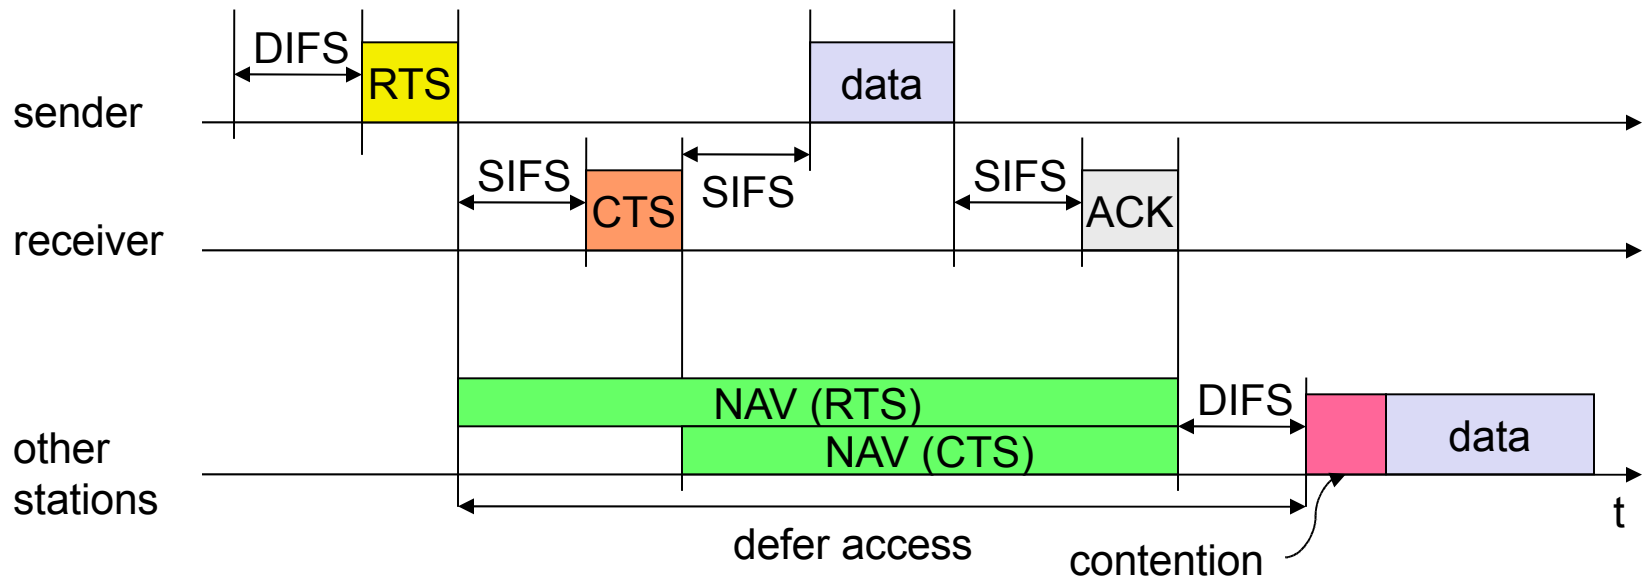

- Sending unicast packets
 - station has to wait for DIFS before sending data
 - receivers acknowledge at once (after waiting for SIFS) if the packet was received correctly (CRC)
 - automatic retransmission of data packets in case of transmission errors

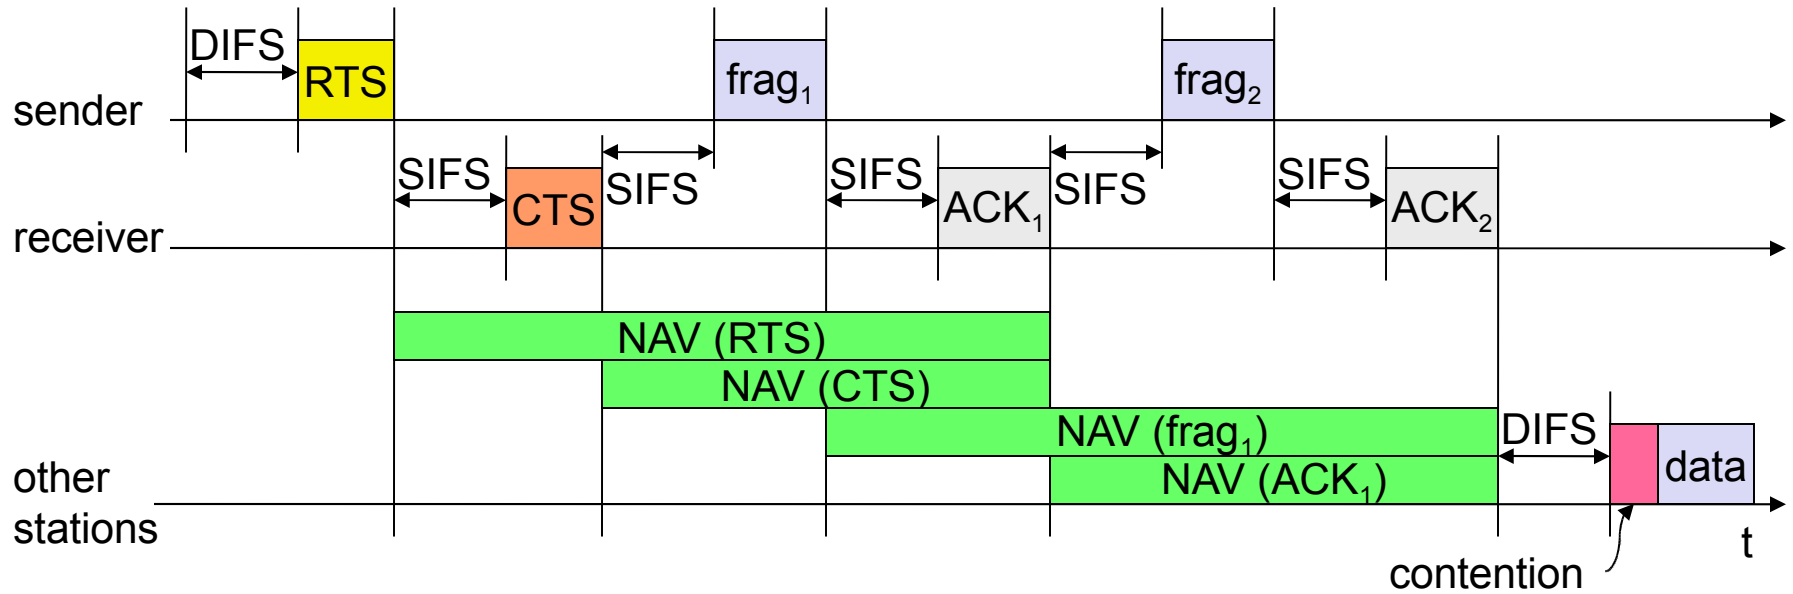

802.11 - DFWMAC

- Sending unicast packets

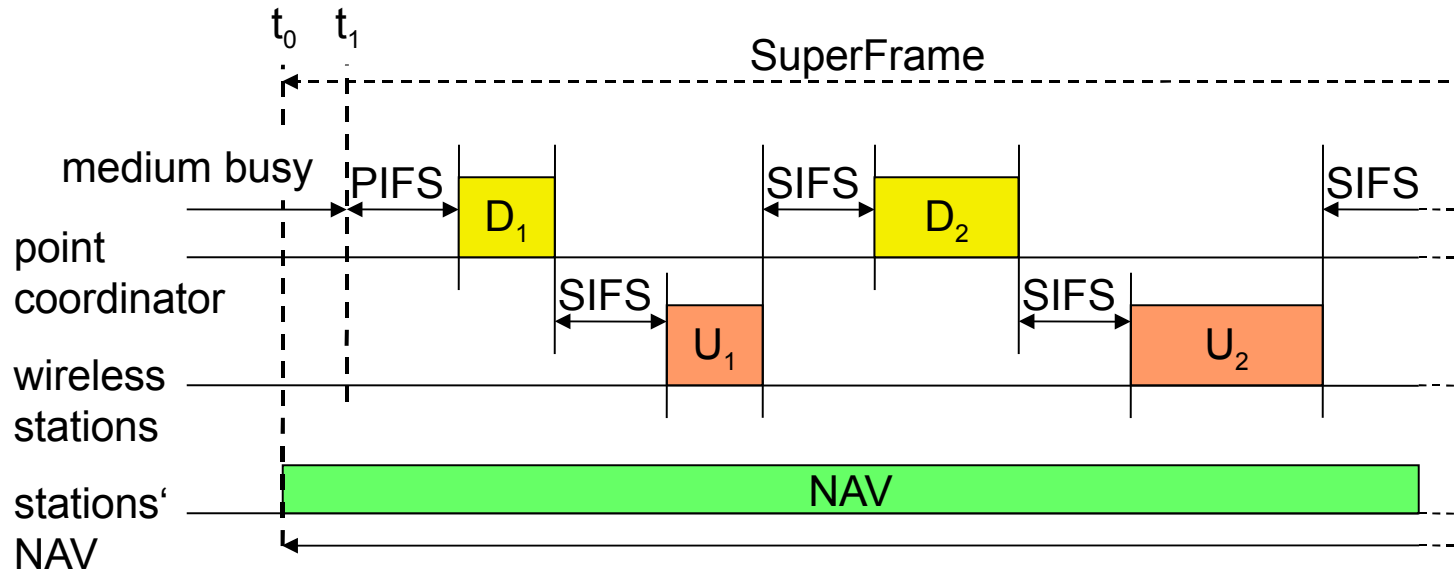

- station can send RTS with reservation parameter after waiting for DIFS (reservation determines amount of time the data packet needs the medium)
- acknowledgement via CTS after SIFS by receiver (if ready to receive)
- sender can now send data at once, acknowledgement via ACK
- other stations store medium reservations distributed via RTS **and** CTS

Fragmentation

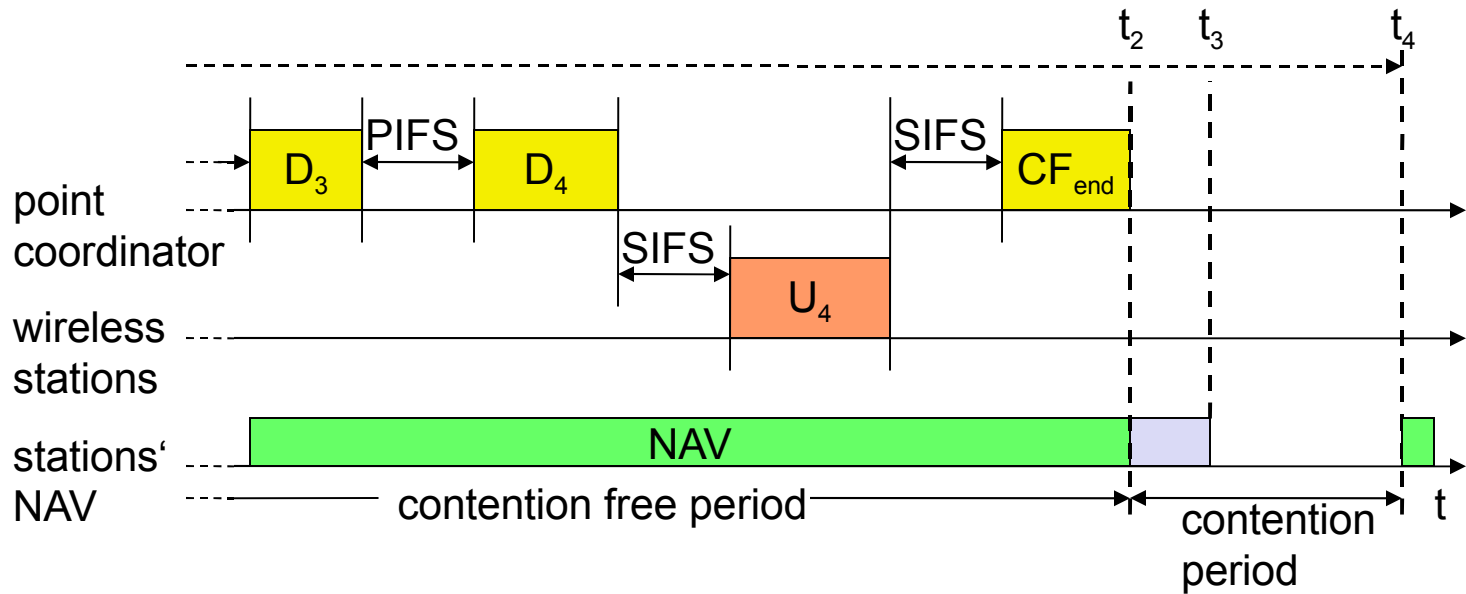

DFWMAC-PCF I (almost never used)

D – downstream data
 U – upstram data

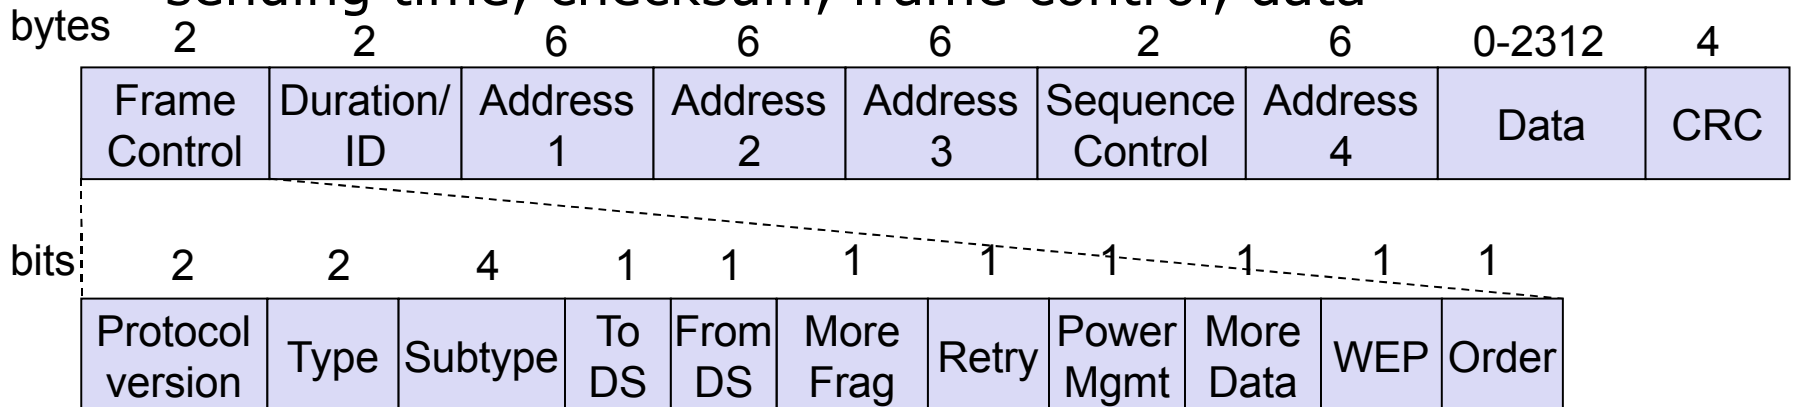

DFWMAC-PCF II

D – downstream data
 U – upstram data

802.11 - Frame format

- Types
 - control, management (e.g. , beacon) and data frames
- Sequence numbers
 - important against duplicated frames due to lost ACKs
- Addresses
 - receiver, transmitter (physical), BSS identifier, sender (logical)
- Miscellaneous
 - sending time, checksum, frame control, data

MAC address format

scenario	to DS	from DS	address 1	address 2	address 3	address 4
ad-hoc network	0	0	DA	SA	BSSID	-
infrastructure network, from AP	0	1	DA	BSSID	SA	-
infrastructure network, to AP	1	0	BSSID	SA	DA	-
infrastructure network, within DS	1	1	RA	TA	DA	SA

DS: Distribution System

AP: Access Point

DA: Destination Address

SA: Source Address

BSSID: Basic Service Set Identifier

RA: Receiver Address

TA: Transmitter Address

Address1 – destination

Address2 – source (ACK will be sent to)

Address3 – filter (often it will carry BSSID addr)

Address4 – Address of the source Access Point

Special Frames: ACK, RTS, CTS

- Acknowledgement

- Request To Send

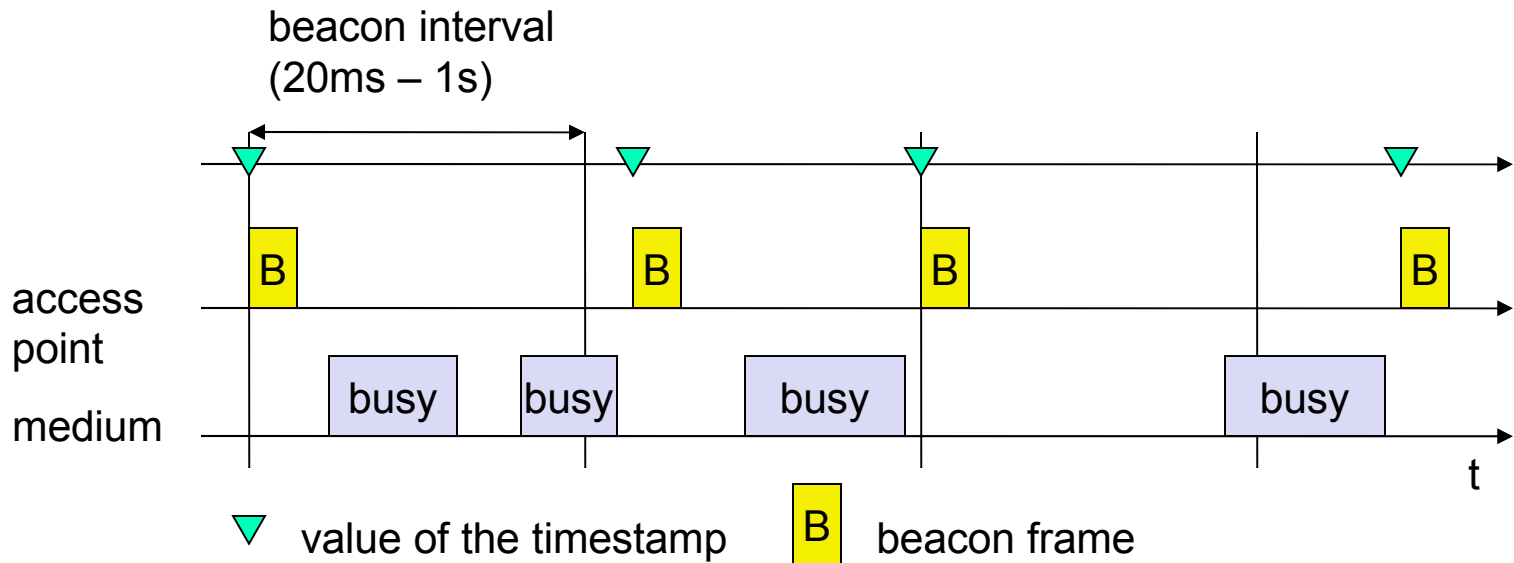

- Clear To Send

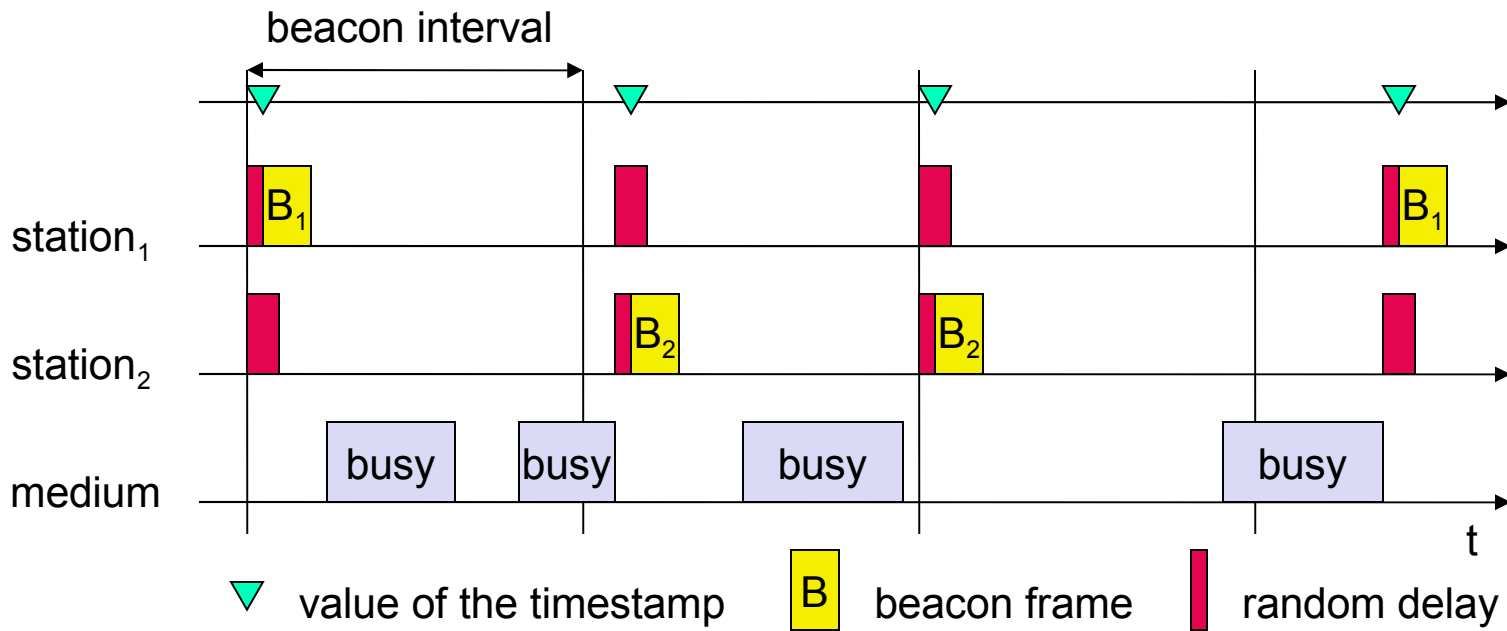

802.11 - MAC management

- Synchronization
 - try to find a LAN, try to stay within a LAN
 - timer etc.
- Power management
 - sleep-mode without missing a message
 - periodic sleep, frame buffering, traffic measurements
- Association/Reassociation
 - integration into a LAN
 - roaming, i.e. change networks by changing access points
 - scanning, i.e. active search for a network
- MIB - Management Information Base
 - managing, read, write

Synchronization using a Beacon (infrastructure)

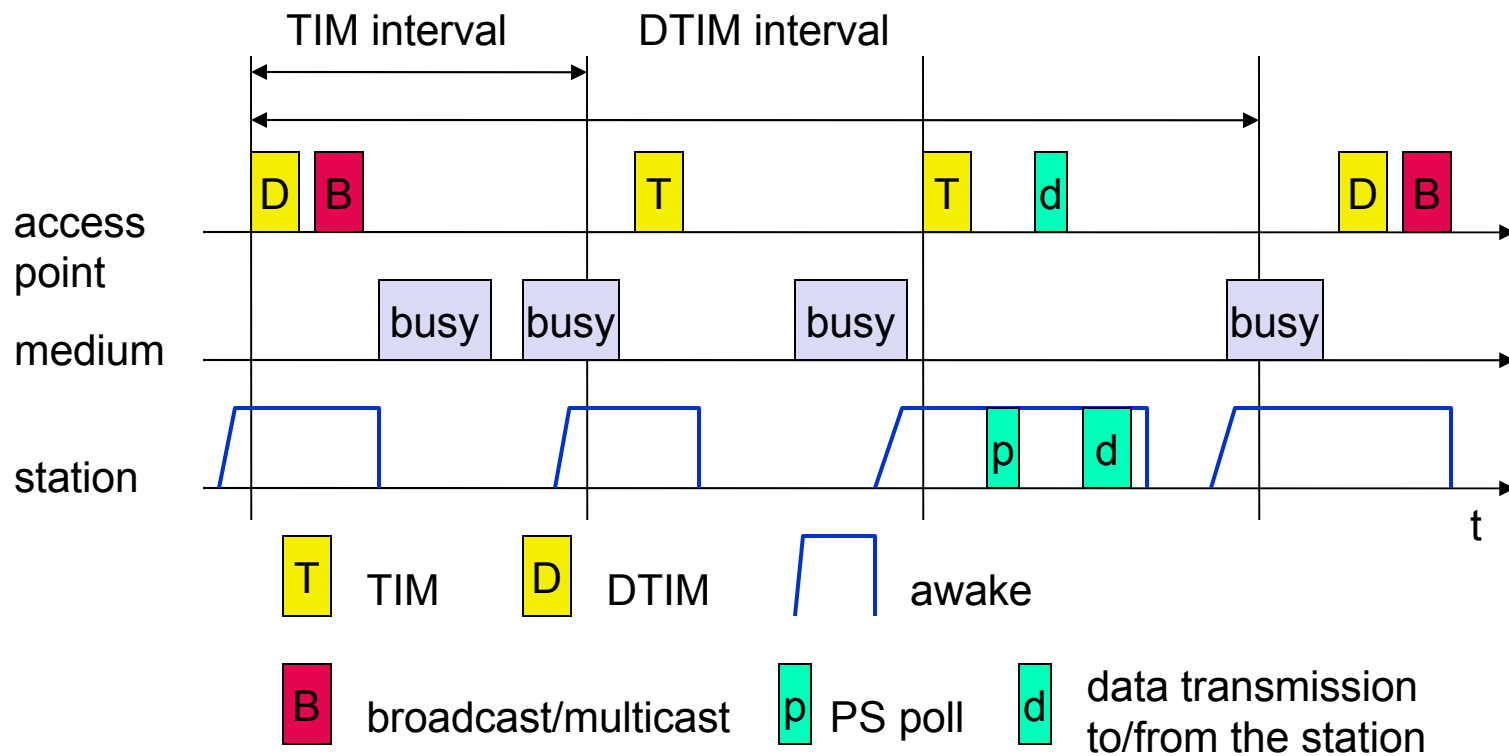

Synchronization using a Beacon (ad-hoc)

Power management

- Idea: switch the transceiver off if not needed
- States of a station: sleep and awake
- Timing Synchronization Function (TSF)
 - stations wake up at the same time
- Infrastructure
 - Traffic Indication Map (TIM)
 - list of unicast receivers transmitted by AP
 - Delivery Traffic Indication Map (DTIM)
 - list of broadcast/multicast receivers transmitted by AP
- Ad-hoc
 - Ad-hoc Traffic Indication Map (ATIM)
 - announcement of receivers by stations buffering frames
 - more complicated - no central AP
 - collision of ATIMs possible (scalability?)
- APSD (Automatic Power Save Delivery)
 - new method in 802.11e replacing above schemes

Power saving with wake-up patterns (infrastructure)

Power saving with wake-up patterns (ad-hoc)

802.11 - Roaming

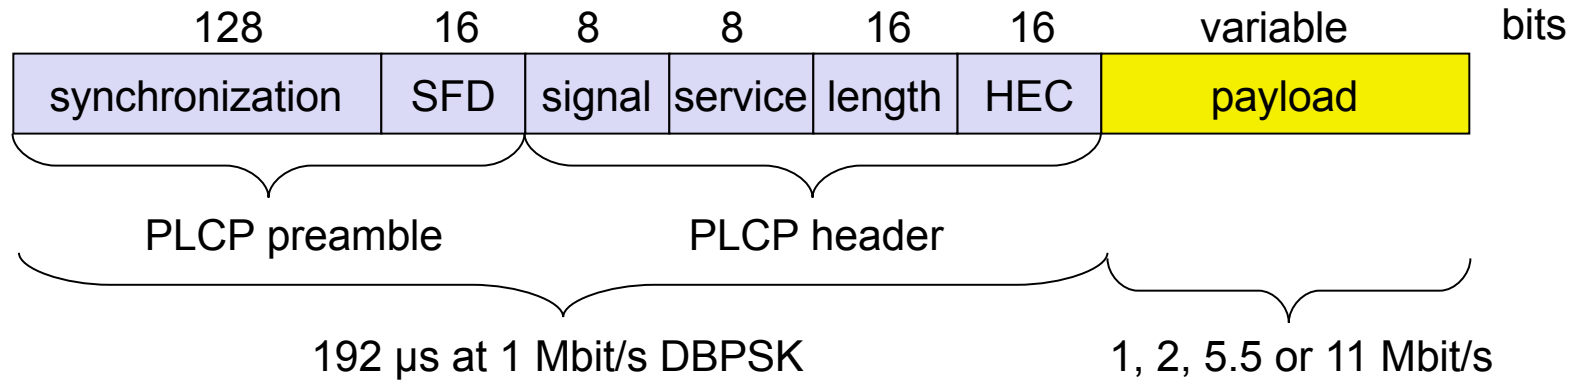

- No or bad connection? Then perform:
- Scanning
 - scan the environment, i.e., listen into the medium for beacon signals or send probes into the medium and wait for an answer
- Reassociation Request
 - station sends a request to one or several AP(s)
- Reassociation Response
 - success: AP has answered, station can now participate
 - failure: continue scanning
- AP accepts Reassociation Request
 - signal the new station to the distribution system
 - the distribution system updates its data base (i.e., location information)
 - typically, the distribution system now informs the old AP so it can release resources
- Fast roaming – 802.11r
 - e.g. for vehicle-to-roadside networks

WLAN: IEEE 802.11b

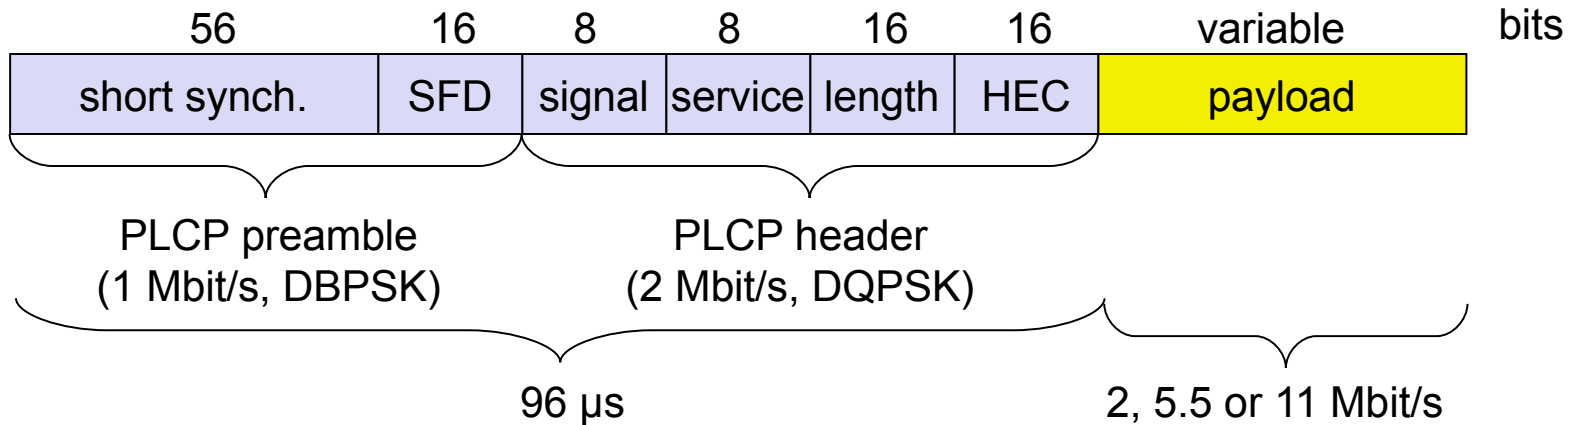

- Data rate
 - 1, 2, 5.5, 11 Mbit/s, depending on SNR
 - User data rate max. approx. 6 Mbit/s
- Transmission range
 - 300m outdoor, 30m indoor
 - Max. data rate ~10m indoor
- Frequency
 - DSSS, 2.4 GHz ISM-band
- Security
 - Limited, WEP insecure, SSID
- Availability
 - Many products, many vendors
- Connection set-up time
 - Connectionless/always on
- Quality of Service
 - Typ. Best effort, no guarantees (unless polling is used, limited support in products)
- Manageability
 - Limited (no automated key distribution, sym. Encryption)
- Special Advantages/Disadvantages
 - Advantage: many installed systems, lot of experience, available worldwide, free ISM-band, many vendors, integrated in laptops, simple system
 - Disadvantage: heavy interference on ISM-band, no service guarantees, slow relative speed only

IEEE 802.11b – PHY frame formats

Long PLCP PDU format

Short PLCP PDU format (optional)

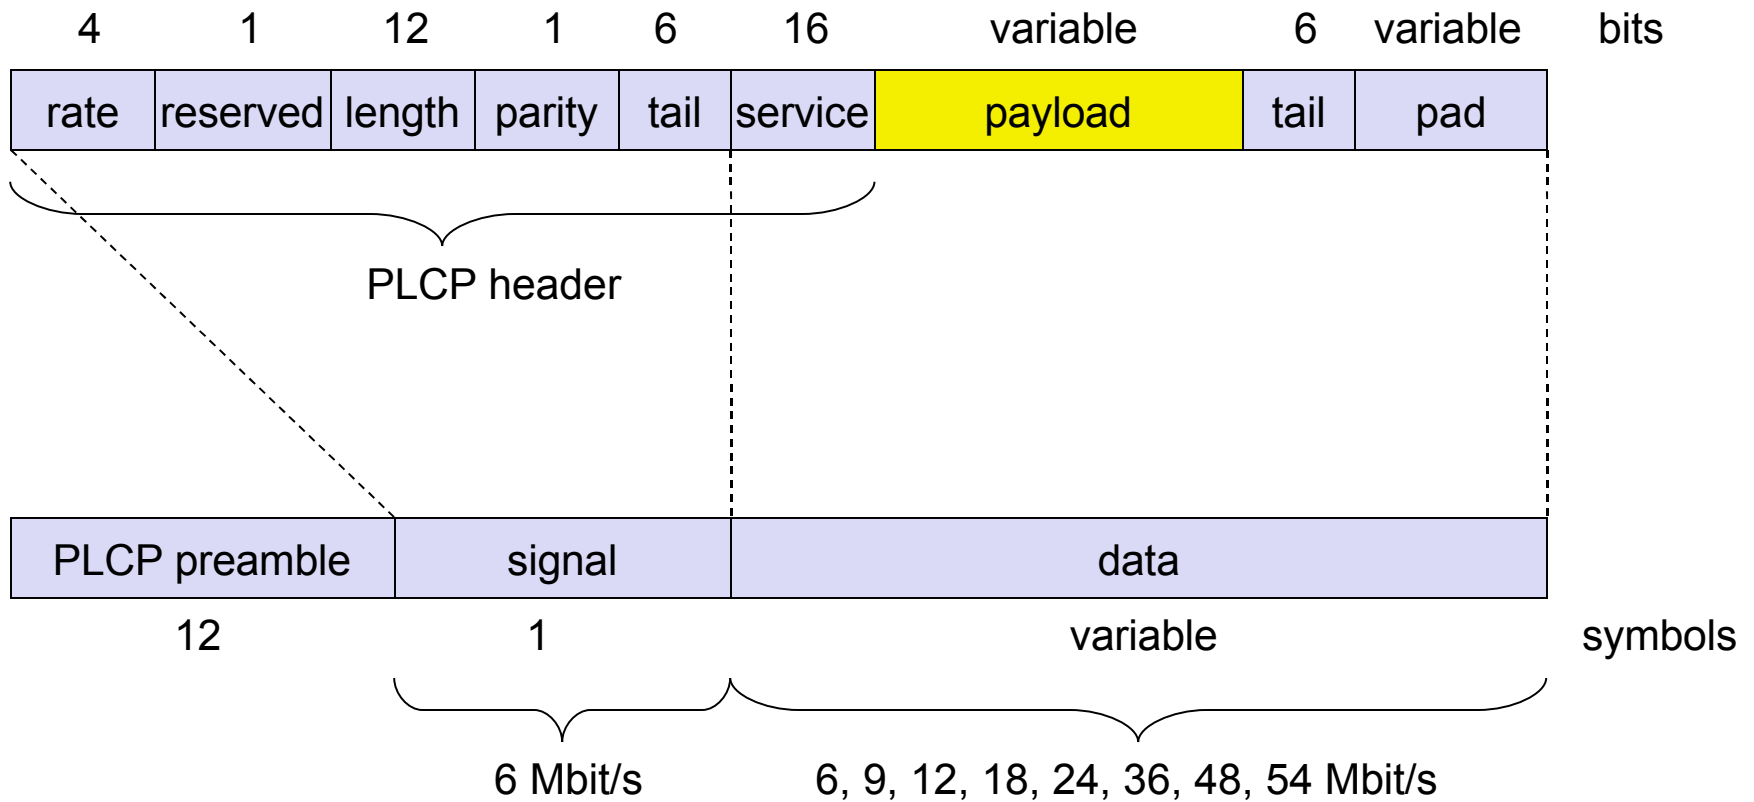

Channel selection (non-overlapping)

WLAN: IEEE 802.11a

- Data rate
 - 6, 9, 12, 18, 24, 36, 48, 54 Mbit/s, depending on SNR
 - User throughput (1500 byte packets): 5.3 (6), 18 (24), 24 (36), 32 (54)
 - 6, 12, 24 Mbit/s mandatory
- Transmission range
 - 100m outdoor, 10m indoor
 - E.g., 54 Mbit/s up to 5 m, 48 up to 12 m, 36 up to 25 m, 24 up to 30m, 18 up to 40 m, 12 up to 60 m
- Frequency
 - Free 5.15-5.25, 5.25-5.35, 5.725-5.825 GHz ISM-band
- Security
 - Limited, WEP insecure, SSID
- Availability
 - Some products, some vendors
- Connection set-up time
 - Connectionless/always on
- Quality of Service
 - Typ. best effort, no guarantees (same as all 802.11 products)
- Manageability
 - Limited (no automated key distribution, sym. Encryption)
- Special Advantages/Disadvantages
 - Advantage: fits into 802.x standards, free ISM-band, available, simple system, uses less crowded 5 GHz band
 - Disadvantage: stronger shading due to higher frequency, no QoS

IEEE 802.11a – PHY frame format

Operating channels of 802.11a in Europe

center frequency =
 $5000 + 5 \cdot \text{channel number}$ [MHz]

Operating channels for 802.11a / US U-NII

center frequency =
 $5000 + 5 \cdot \text{channel number}$ [MHz]

OFDM in IEEE 802.11a

- OFDM with 52 used subcarriers (64 in total)
 - 48 data + 4 pilot
 - (plus 12 virtual subcarriers)
 - 312.5 kHz spacing
