Tempo = $V.T_{\text{EXTRACT-MIN}} + E.T_{\text{DECREASE-KEY}}$

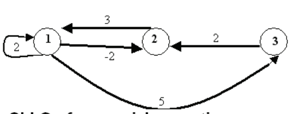
Q	$T_{\text{EXTRACT-MIN}}$	$T_{\text{DECREASE-KEY}}$	Total
array	$O(V)$	$O(1)$	$O(V^2)$
binary heap	$O(\lg V)$	$O(\lg V)$	$O(E \lg V)$

Caminhos entre todos os pares

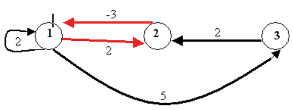
- **Entrada**: Grafo direcionado $G = (V, E)$, com uma função de peso $w : E \rightarrow \mathbb{R}$.
- **Saída**: matriz $n \times n$ com os pesos dos menores caminhos $\delta(i, j)$ entre todos os vértices $i, j \in V$.

Floyd-Warshall

- O algoritmo de Floyd-Warshall determina as distâncias dos menores caminhos entre todos os pares de vértices de um grafo.
- Trabalha com arestas com pesos negativos.
- Mas não funciona quando existem ciclos negativos no grafo.



Ok! Grafo sem ciclo negativo



Nada feito. Grafo com ciclo negativo (arestas vermelhas)

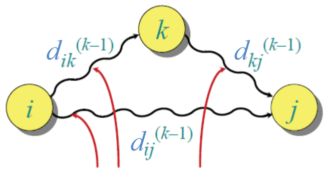
Floyd-Warshall

- Ideia
  - $d_{ij}^{(k)}$: peso do menor caminho do vértice i ao vértice j cujos vértices intermediários pertencem ao conjunto $\{1,2,\ldots,k\}$
  - Começar com k=0 e ir atualizando a matriz incrementando o valor de k, ou seja, inserindo mais um vértice no conjunto de vértices intermediários permitidos.

$$d_{ij}^{(k)} = \begin{cases} w_{ij} & \text{if } k = 0 , \\ \min\left(d_{ij}^{(k-1)}, d_{ik}^{(k-1)} + d_{kj}^{(k-1)}\right) & \text{if } k \geq 1 . \end{cases}$$

Floyd-Warshall
(Cormen, 2001; MIT OpenCourseWare)

$$d_{ij}^{(k)} = \begin{cases} w_{ij} & \text{if } k = 0, \\ \min\left(d_{ij}^{(k-1)}, d_{ik}^{(k-1)} + d_{kj}^{(k-1)}\right) & \text{if } k \geq 1. \end{cases}$$



Floyd-Warshall (Cormen, 2001)

- W: matriz representando os pesos das arestas:

$$w_{ij} = \begin{cases} 0 & \text{if } i = j, \\ \text{the weight of directed edge } (i, j) & \text{if } i \neq j \text{ and } (i, j) \in E, \\ \infty & \text{if } i \neq j \text{ and } (i, j) \notin E. \end{cases}$$

- Algoritmo:

```
FLOYD-WARSHALL(W)
n ← rows[W]
D^(0) ← W
for k ← 1 to n
     do for i ← 1 to n
            do for j ← 1 to n
                   do d_ij^(k) ← min(d_ij^(k-1), d_ik^(k-1) + d_kj^(k-1))
return D^(n)
```

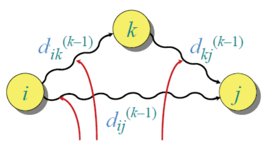
- Caminho?
  - π_{ij}: predecessor do vértice *j* no menor caminho de *i* para *j* com todos os intermediários pertencendo ao conjunto $\{1,2,\ldots,k\}$.

$$\pi_{ij}^{(0)} = \begin{cases} \text{NIL} & \text{if } i = j \text{ or } w_{ij} = \infty, \\ i & \text{if } i \neq j \text{ and } w_{ij} < \infty. \end{cases}$$



$$\pi_{ij}^{(k)} = \begin{cases} \pi_{ij}^{(k-1)} & \text{if } d_{ij}^{(k-1)} \leq d_{ik}^{(k-1)} + d_{kj}^{(k-1)}, \\ \pi_{kj}^{(k-1)} & \text{if } d_{ij}^{(k-1)} > d_{ik}^{(k-1)} + d_{kj}^{(k-1)}. \end{cases}$$

FLOYD-WARSHALL(W)

```
n ← rows[W]
D^(0) ← W
for k ← 1 to n
    do for i ← 1 to n
        do for j ← 1 to n

- $O(n^3)$
  - n = número de vértices
- Simples de codificar
- Eficiente na prática
